

# *AquaMark Booster System*

## **Installation, Operation & Maintenance Manual**

### **Model: AM-LG1.5**

**Electrical Supply: 240Volt 60Hz 1Ph**

## **THIS PUMP MUST BE PRIMED!**

To prime this pump after initial installation you must close the outlet ball valve (to the building). Open the supply-line ball valve. Loosen the vent plug, leave loose until all air escapes and you get a slight amount of water.

### **See Piping Diagram:**

In normal operation a bypass valve should be installed and is to remain closed.

In normal operation the supply valve from the city water main **MUST** remain open.

In normal operation the valve to the building is open.

Yearly inspections should be made to check for leaks or unusual noise and proper maintenance procedures performed if necessary.

# AM-LG1.5 PRESSURE BOOSTER SYSTEM

## Installation & Operation Manual

### Installation:

- If possible leave at least 12" around the pressure booster so the unit can be easily serviced.
- Plumb pressure booster as shown in diagram in this manual.
- Always supply pressure booster with correct size pipe (as noted in manual).
- Install unions on both the inlet and outlet side of the booster. If needed the unit can be removed for service.
- Install vibration isolator on outlet side of pressure booster to eliminate vibration if desired
- Inlet and Outlet of equal size
- Have a licensed electrician run the 240-208 volt 60 Hz 3 Phase 20 AMP power to an electrical box mounted on the wall. This electrical box should be located near the pressure booster, and easily accessible. Connect the 6' cord from the booster to the electrical box.

### Operation:

- Open inlet ball valve.
- Open outlet ball valve.
- Turn On Power
- Pump will turn on and come up to pressure.
- You're done!

### Maintenance:

- This booster has been designed to be maintenance free for many years.
- Do not rest items against switches, gauges, tank drain valves, or pressure relief valve.
- Do not rest items against pumps, the pump is air cooled and needs space to dissipate heat and take in fresh air. Leave at least 12" of space around the pump.
- For parts or questions regarding installation or service of this booster please contact AquaMark Service at:
  - H.O.K. Sales Inc.
  - 
  - Ph 800-323-4498 Fx 888-246-5725

A Larger Tank Can Be Installed After The Booster For Longer Shutdown Periods During Low Flows.

Model CDU

EBARA Stainless Steel Centrifugal Pumps

Performance Curves

CDU120/3-1 1/2 HP

Synchronous Speed: 3450 RPM

Size: 1 x 1 1/4 x 5 3/16

## THIS PUMP MUST BE PRIMED!

Open the city water supply valve to the booster. Open the discharge valve from the pressure booster system that supplies water to the building. Run water in the building for a minute. This will force water into the pump housing from the city. The pump will be primed.

- We recommend a bypass valve configuration be installed on ALL booster pump installations.
- In normal operation the bypass valve should be in the closed position.
- In normal operation the supply line valve from the city water main MUST remain open.
- In normal operation the discharge valve to the building from the booster should be open.
- There is a relief valve included and installed on this AquaMark pressure booster system. This relief valve discharge shall be piped to a floor drain.
- Yearly inspections should be made to check for leaks or unusual noise and proper maintenance procedures performed if necessary.

**Relief valve discharge outlet shall be piped to floor drain. Follow local codes pertaining to relief valve piping and drainage.**

# Installation

- Leave 12" of clear space around the pressure booster to allow for service work to be performed as necessary in the future.
- Plumb pressure booster as shown in the diagram included in this manual.
- Supply pressure booster with correct incoming minimum supply line size (or greater) as noted on the first page of this manual.
- Plumb a three valve bypass system during installation of this pressure booster. When service needs to be performed this will allow normal city water pressure to be supplied to the building while servicing/repairing the pressure booster system.
- Unions are recommended when installing this pressure booster system.
- Optional accessories include anti-vibration mat, vibration isolator and diaphragm type tank to be installed after the booster system (the tank will allow for extended shut down periods during low flow demands).
- Have your electrician supply this pressure booster with a dedicated circuit.

# Operation

- Make sure valve from city water supply to the pressure booster is in the full open position.
- Make sure valve on the discharge side of the pressure booster is in the full open position.
- Make sure that the bypass valve line is in the full closed position (if the bypass valve is in the open position the pressure booster will not shut off).
- Supply electrical power to the pressure booster by switching the wall mounted cut-off switch to the on position.
- Pressure booster will turn on and boost pressure to the desired set-point. Pressure booster will continue to run until the demand has been met. Pressure booster will enter sleep mode after demand has been met and a pre-determined amount of time has passed.

# Maintenance

- This pressure booster has been designed to be maintenance free for many years.
- Do not rest items against switches, gauges, tank drain valves, or pressure relief valve.
- Do not rest items against pump. The pump requires free air space surrounding it to dissipate heat and take in fresh air for cooling purposes. Leave 12" of free air space all around the system.

# Model 3U/CDU

## Features

- **Close coupled design**
  - saves space; simplifies maintenance and installation
- **Stainless steel liquid end components**
  - high quality; corrosion resistance
- **Versatile mounting**
  - can be installed horizontally or vertically
- **Back pullout construction**
  - assembly and overhaul of the impeller and seal without disturbing suction and discharge connections
- **Top centerline discharge and foot support under casing**
  - ensures self-venting and reduces misalignment from pipe loads
- **High operating efficiency**
  - lowers operating costs
- **High quality mechanical shaft seals and o-rings**
  - available for standard pumping requirements or optional high temperature and chemical duty operation

\*Note: NSF/ANSI 61 Annex G listed

Compliant to NSF/ANSI 61 Annex G

## Applications

- Plant services
- Water supply systems
- Washing plants
- Cooling water
- Car wash
- Scrubbers
- Ultrapure water systems
- Jockey pump services
- Air conditioning
- Sprinkler/flow irrigation
- OEM equipment application
- Pressure boosting
- Liquid transfer
- Heat exchanger
- Spray systems
- Heating
- Beverage processing
- Pharmaceutical services
- Water reclamation and treatment
- General pump applications

## About These Instructions

This documentation applies to the SMV frequency inverter and contains important technical data regarding the installation, operation, and commissioning of the inverter.

These instructions are only valid for SMV frequency inverters with software revision 4.23 or higher for version 4.23 software, the drive nameplate illustrated below would show "42" in the "F" location.

Please read these instructions in their entirety before commissioning the drive.

# 1 Safety Information

## General

Some parts of Lenze AC Tech controllers can be electrically live and some surfaces can be hot. Non-authorized removal of the required cover, inappropriate use, and incorrect installation or operation creates the risk of severe injury to personnel and/or damage to equipment.

All operations concerning transport, installation, and commissioning as well as maintenance must be carried out by qualified, skilled personnel who are familiar with the installation, assembly, commissioning, and operation of variable frequency drives and the application for which it is being used.

## Installation

Ensure proper handling and avoid excessive mechanical stress. Do not bend any components and do not change any insulation distances during transport, handling, installation or maintenance. Do not touch any electronic components or contacts. This drive contains electrostatically sensitive components, which can easily be damaged by inappropriate handling. Static control precautions must be adhered to during installation, testing, servicing and repairing of this drive and associated options. Component damage may result if proper procedures are not followed.

To ensure proper operation, do not install the drive where it is subjected to adverse environmental conditions such as combustible, oily, or hazardous vapors; corrosive chemicals; excessive dust, moisture or vibration; direct sunlight or extreme temperatures.

This drive has been tested by Underwriters Laboratory (UL) and is UL Listed in compliance with the UL508C Safety Standard. This drive must be installed and configured in accordance with both national and international standards. Local codes and regulations take precedence over recommendations provided in this and other Lenze AC Tech documentation.

The SMVector drive is considered a component for integration into a machine or process. It is neither a machine nor a device ready for use in accordance with European directives (reference machinery directive and electromagnetic compatibility directive). It is the responsibility of the end user to ensure that the machine meets the applicable standards.

## Electrical Connection

When working on live drive controllers, applicable national safety regulations must be observed. The electrical installation must be carried out according to the appropriate regulations (e.g. cable cross-sections, fuses, protective earth [PE] connection). While this document does make recommendations in regards to these items, national and local codes must be adhered to.

The documentation contains information about installation in compliance with EMC (shielding, grounding, filters and cables). These notes must also be observed for CE-marked controllers. The manufacturer of the system or machine is responsible for compliance with the required limit values demanded by EMC legislation.

## Application

The drive must not be used as a safety device for machines where there is a risk of personal injury or material damage. Emergency Stops, over-speed protection, acceleration and deceleration limits, etc must be made by other devices to ensure operation under all conditions.

The drive does feature many protection devices that work to protect the drive and the driven equipment by generating a fault and shutting the drive and motor down. Mains power variances can also result in shutdown of the drive. When the fault condition disappears or is cleared, the drive can be configured to automatically restart, it is the responsibility of the user, OEM and/or integrator to ensure that the drive is configured for safe operation.

## Safety Information

### Explosion Proof Applications

Explosion proof motors that are not rated for inverter use lose their certification when used for variable speed. Due to the many areas of liability that may be encountered when dealing with these applications, the following statement of policy applies:

Lenze AC Tech Corporation inverter products are sold with no warranty of fitness for a particular purpose or warranty of suitability for use with explosion proof motors. Lenze AC Tech Corporation accepts no responsibility for any direct, incidental or consequential loss, cost or damage that may arise through the use of AC inverter products in these applications. The purchaser expressly agrees to assume all risk of any loss, cost or damage that may arise from such application.

### Operation

Systems including controllers must be equipped with additional monitoring and protection devices according to the corresponding standards (e.g. technical equipment, regulations for prevention of accidents, etc.). The controller may be adapted to your application as described in this documentation.

#### DANGER!

- After the controller has been disconnected from the supply voltage, live components and power connection must not be touched immediately, since capacitors could be charged. Please observe the corresponding notes on the controller.
- Close all protective covers and doors prior to and during operation.
- Do not cycle input power to the controller more than once every two minutes.
- For SMVector models that are equipped with a Disconnect Switch (11th character in model number is L or M), the Disconnect Switch is intended as a motor service disconnect and does not provide branch circuit protection to the inverter or motor. When servicing the motor, it is necessary to wait 3 minutes after turning this switch to the off position before working on motor power wiring as the inverter stores electrical power. To service the inverter, it is necessary to remove mains ahead of the drive and wait 3 minutes.

### Safety Notifications

All safety information given in these Operating Instructions includes a visual icon, a bold signal word and a description.

**Signal Word!** (characterizes the severity of the danger)

**NOTE** (describes the danger and informs on how to proceed)

| Icon | Signal Word                           | Meaning  | Consequences if Ignored   |
|------|---------------------------------------|--|---|
|      | <b>DANGER!</b>                        | Warns of hazardous electrical voltage.   | Death or severe injuries.   |
|      | <b>WARNING!</b>                       | Warns of potential, very hazardous situations.   | Risk of severe injury to personnel and/or damage to equipment.            |
|      | <b>WARNING!</b><br><b>Hot Surface</b> | Warns of hot surface and risk of burns. Labels may be on or inside the equipment to alert people that surfaces may reach dangerous temperatures. | Risk of severe injury to personnel.                                       |
|      | <b>STOP!</b>                          | Warns of potential damage to material and equipment.   | Damage to the controller/drive or its environment.                        |
|      | <b>NOTE</b>                           | Designates a general, useful note.   | None. If observed, then using the controller/drive system is made easier. |

## Safety Information

### Harmonics Notification in accordance with EN 61000-3-2, EN 61000-3-12:

Operation in public supply networks (Limitation of harmonic currents i.a.w. EN 61000-3-2, Electromagnetic Compatibility (EMC) Limits). Limits for harmonic current emissions (equipment input current up to 16A/phase).

| Directive     | Total Power connected to Mains (public supply) | Additional Measures Required for Compliance <sup>(1)</sup>        |
|---------------|--|---|
| EN 61000-3-2  | < 0.5kW  | with mains choke  |
|               | 0.5 ... 1kW                                    | with active filter  |
|               | > 1kW  | complies without additional measures                              |
| EN 61000-3-12 | 16 ... 75amp                                   | Additional measures are required for compliance with the standard |

(1) For compliance with EMC regulations, the permissible cable lengths may change.

(2) The additional measures described only ensure that the controller meets the requirements of the EN 61000-3-2. The machine/system manufacturer is responsible for the machine's compliance with the regulations.

### Safety Information in accordance with EN 61800-5-1:

#### DANGER! - Risk of Electric Shock

Capacitors retain charge for approximately 180 seconds after power is removed. Disconnect incoming power and wait at least 3 minutes before touching the drive.

#### DANGER! - Risque de choc électrique

Les condensateurs restent sous charge pendant environ 180 secondes après une coupure de courant. Couper l'alimentation et patienter pendant au moins 3 minutes avant de toucher l'entraînement.

#### WARNING!

- This product can cause a d.c. current in the PE conductor. Where a residual current-operated (RCD) or monitoring (RCM) device is used for protection in case of direct or indirect contact, only an RCD or RCM Type B is allowed on the supply side of this product.
- Leakage Current may exceed 3.5mA AC. The minimum size of the PE conductor shall comply with local safety regulations for high leakage current equipment.
- In a domestic environment, this product may cause radio interference in which case supplementary mitigation measures may be required.

## Safety Information

### Safety Information in accordance with UL:

Note for UL approved system with integrated controllers: UL warnings are notes which apply to UL systems. The documentation contains special information about UL.

- Integral solid state protection does not provide branch circuit protection. Branch circuit protection must be provided in accordance with the National Electrical Code and any additional local codes. The use of fuses or circuit breakers is the only approved means for branch circuit protection.
- When protected by CC and T Class Fuses, suitable for use on a circuit capable of delivering not more than 200,000 rms symmetrical amperes, at the maximum voltage rating marked on the drive.
- Additionally suitable when protected by a circuit breaker having an interrupting rating not less than 200,000 rms symmetrical amperes, at the maximum voltage rating marked on the drive. (Excludes ESV113xx2T, ESV153xx2T, ESV113xx4T, ESV153xx4T, ESV183xx4T, ESV223xx4T, ESV303xx4T, ESV113xx6T, ESV153xx6T, ESV183xx6T, ESV223xx6T, and ESV303xx6T).
- Use minimum 75°C copper wire only, except for control circuits.
- For control circuits, use wiring suitable for NEC Class 1 circuits only.
- Torque Requirements (in accordance with UL) are listed in section 3.2.1, Power Connections and in 3.2.3, Control terminals
- Shall be installed in a pollution degree 2 macro-environment.
- NEMA 1 (IP31) models shall be installed in a pollution degree 2 macro-environment.
- All models are suitable for installation in a compartment handling Conditioned Air (i.e., plenum rated).

#### WARNING!

The opening of branch-circuit protective device may be an indication that a fault has been interrupted. To reduce the risk of fire or electric shock, current carrying parts and other components of the controller should be examined and replaced if damaged.

#### AVERTISSEMENT!

Le déclenchement du dispositif de protection du circuit de dérivation peut être dû à une coupure qui résulte d'un courant de défaut. Pour limiter le risque d'incendie ou de choc électrique, examiner les pièces porteuses de courant et les autres éléments du contrôleur et les remplacer s'ils sont endommagés. En cas de grillage de l'élément traversé par le courant dans un relais de surcharge, le relais tout entier doit être remplacé.

#### NOTE

Control and communications terminals provide reinforced insulation (i.e. considered SELV or PELV, providing protection in case of direct contact) when the drive is connected to a power system rated up to 300VAC between phase to ground (PE) and the applied voltage on Terminals 16 and 17 is less than 150VAC between phase to ground. Otherwise, control and communications terminals provide basic insulation.

| Enclosure   | IP31/NEMA 1  | IP65/NEMA 4X  |
|   | NEMA 1 and NEMA 4X model enclosures are plenum rated in accordance with UL 508C and are suitable for installation in a compartment handling conditioned air.     |   |
| Protection measures against   | Earth fault, phase loss, over voltage, under voltage, motor stalling, over temperature motor overload (125% of FLA), short circuit (SCCR=200kA at rated voltage) |   |
| Compliance with EN 61000-3-2 Requirements <sup>(2)</sup>  | < 0.5kW  | with mains choke  |
|   | 0.5 ... 1kW  | with active filter  |
|   | > 1kW  | without additional measures   |
| Compliance with EN 61000-3-12 Requirements <sup>(2)</sup>   | 16 ... 75amp   | Additional measures required for compliance with EN 61000-3-12  |

Operation in public supply networks (Limitation of harmonic currents i.a.w. EN 61000-3-2, Electromagnetic Compatibility (EMC) Limits). Limits for harmonic current emissions (equipment input current up to 16A/phase).

(1) The stated cable lengths are permissible at default carrier frequencies (refer to parameter P166).

(2) The additional measures described only ensure that the controller meets the requirements of the EN 61000-3-2. The machine/system manufacturer is responsible for the machine's compliance with the regulations.

## Technical Data

### 2.2 SMV Type Number Designation

The table herein describes the Type numbering designation for the SMVector Inverter models.

|   | ESV | 152                    | NO | 2 | T | X | B |
|---|-----|------------------------|----|---|---|---|---|
| Electrical Products in the SMVector Series  |     |                        |    |   |   |   |   |
| <b>Power Rating in kW:</b>  |     |                        |    |   |   |   |   |
| 251 = 0.25kW (0.33HP)   |     | 113 = 11.0kW (15HP)    |    |   |   |   |   |
| 371 = 0.37kW (0.5HP)  |     | 153 = 15.0kW (20HP)    |    |   |   |   |   |
| 751 = 0.75kW (1HP)  |     | 183 = 18.5kW (25HP)    |    |   |   |   |   |
| 112 = 1.1kW (1.5HP)   |     | 223 = 22.0kW (30HP)    |    |   |   |   |   |
| 152 = 1.5kW (2HP)   |     | 303 = 30.0kW (40HP)    |    |   |   |   |   |
| 222 = 2.2kW (3HP)   |     | 373 = 37.5kW (50HP)    |    |   |   |   |   |
| 302 = 3.0kW (4HP)   |     | 453 = 45.0kW (60HP)    |    |   |   |   |   |
| 402 = 4.0kW (5HP)   |     |                        |    |   |   |   |   |
| 552 = 5.5kW (7.5HP)   |     |                        |    |   |   |   |   |
| 752 = 7.5kW (10HP)  |     |                        |    |   |   |   |   |

| D = NEMA 4X/IP65; Indoor only; Fan cooled   |     |                        |    |   |   |   |   |
| E = NEMA 4X/IP65; Indoor/Outdoor; Convection cooled                                 |     |                        |    |   |   |   |   |
| F = NEMA 4X/IP65; Indoor/Outdoor; Fan cooled  |     |                        |    |   |   |   |   |

#### NOTE

Prior to installation make sure the enclosure is suitable for the end-use environment

Variables that influence enclosure suitability include (but are not limited to) temperature, airborne contaminants, chemical concentration, mechanical stress and duration of exposure (sunlight, wind, precipitation).

### NOTES:

Output Current: The Output Current Maximum (%) is a percentage of the Output Current Continuous Amps (In) rating and is adjustable in parameter P171.

For 400...480 VAC models, the output current maximum (%) in the 400V column is used when P107 = 0

For 400...480 VAC models, the output current maximum (%) in the 480V column is used when P107 = 1

| ESV453--6T--                                    | 60    | 45   | 71            | 62                          | 180        | 1395              |                       |                       |

**NOTES:**

Output Current: The Output Current Maximum (%) is a percentage of the Output Current Continuous Amps (In) rating and is adjustable in parameter P171.

**STOP!**

- For installations above 1000m a.m.s.l., derate I<sub>n</sub> by 5% per 1000m, do not exceed 4000m a.m.s.l.
- Operation above 40°C, derate I<sub>n</sub> by 2.5% per °C, do not exceed 55°C.

Output Current (In) derating for Carrier Frequency (P166) for NEMA 1 (IP31) Models:

- If P166=2 (8 kHz), derate I<sub>n</sub> to 92% of drive rating
- If P166=3 (10 kHz), derate I<sub>n</sub> to 84% of drive rating

Output Current (In) derating for Carrier Frequency (P166) for NEMA 4X (IP65) Models:

- If P166=1 (6 kHz), derate I<sub>n</sub> to 92% of drive rating
- If P166=2 (8 kHz), derate I<sub>n</sub> to 84% of drive rating
- If P166=3 (10 kHz), derate I<sub>n</sub> to 76% of drive rating

## Installation

### 3 Installation

#### 3.1 Dimensions and Mounting

##### WARNING!

Drives must not be installed where subjected to adverse environmental conditions such as: combustible, oily, or hazardous vapors; corrosive chemicals; excessive dust, moisture or vibration; direct sunlight or extreme temperatures.

##### 3.1.1 NEMA 1 (IP31) Models ≤ 30HP (22kW)

# Installation

## 3.2 Electrical Installation

### Installation After a Long Period of Storage

#### STOP!

Severe damage to the drive can result if it is operated after a long period of storage or inactivity without reforming the DC bus capacitors.

If input power has not been applied to the drive for a period of time exceeding three years (due to storage, etc), the electrolytic DC bus capacitors within the drive can change internally, resulting in excessive leakage current. This can result in premature failure of the capacitors if the drive is operated after such a long period of inactivity or storage.

In order to reform the capacitors and prepare the drive for operation after a long period of inactivity, apply input power to the drive for 8 hours prior to actually operating the motor.

### 3.2.1 Power Connections

#### STOP!

If the kVA rating of the AC supply transformer is greater than 10 times the input kVA rating of the drive(s), an isolation transformer or 2-3% input line reactor must be added to the line side of the drive(s).

#### DANGER! Hazard of electrical shock!

Circuit potentials up to 600 VAC are possible. Capacitors retain charge after power is removed. Disconnect power and wait at least three minutes before servicing the drive.

#### STOP!

- Verify mains voltage before connecting to drive.
- Do not connect mains power to the output terminals (U,V,W)! Severe damage to the drive will result.
- Do not cycle mains power more than once every two minutes. Damage to the drive may result.

| Mains and Motor Terminations   |                          |                |  |

| ESV113xx2xxx, ESV153xx2xxx, ESV183xx4xxx, ESV223xx4xxx, ESV303xx4xxx   | 24 lb-in (2.7 Nm)        | 7/16 in (10mm) |  |
| ESV373xx4xxx, ESV453xx4xxx   | 27 lb-in (3.05 Nm)       | 0.75 in (19mm) |  |
| Torque: N4X/IP65 Door Screws   |                          |                |  |
| N4X/IP65   | 6-7 lb-in (0.67-0.79 Nm) | 0.25 in (6mm)  |  |

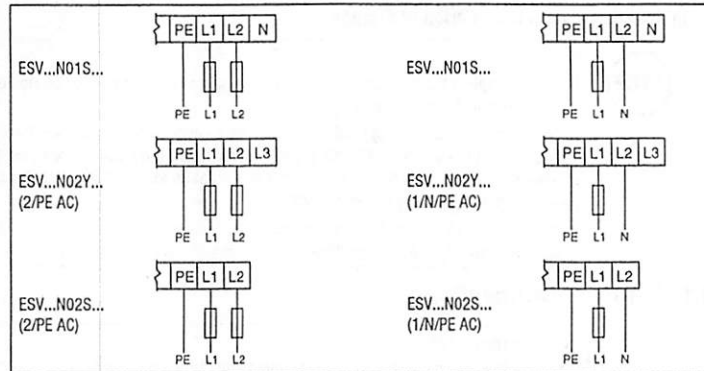

### 3.2.1.1 Mains Connection to 120VAC Single-Phase Supply

## Installation

### 3.2.1.2 Mains Connection to 240VAC Single-Phase Supply

### 3.2.1.3 Mains Connection to Three-Phase Supply

### 3.2.1.4 Motor Connection

#### WARNING!

If the cable connection between the drive and the motor has an in-line contactor or circuit breaker then the drive must be stopped prior to opening/closing the contacts. Failure to do so may result in overcurrent trips and/or damage to the inverter.

#### WARNING!

Leakage current may exceed 3.5 mA AC. The minimum size of the protective earth (PE) conductor shall comply with local safety regulations for high leakage current equipment.

#### STOP!

In the case of a Spinning Motor:

To bring free-wheeling loads such as fans to a rest before starting the drive, use the DC injection braking function. Starting a drive into a freewheeling motor creates a direct short-circuit and may result in damage to the drive.

Confirm motor suitability for use with DC injection braking.  
Consult parameter P110 for starting / restarting into spinning motors.

## Installation

### 3.2.1.5 Installation Recommendations for EMC Compliance

For compliance with EN 61800-3 or other EMC standards, motor cables, line cables and control or communications cables must be shielded with each shield/screen clamped to the drive chassis. This clamp is typically located at the conduit mounting plate.

The EMC requirements apply to the final installation in its entirety, not to the individual components used. Because every installation is different, the recommended installation should follow these guidelines as a minimum. Additional equipment (such as ferrite core absorbers on power conductors) or alternative practices may be required to meet conformance in some installations.

Motor cable should be low capacitance (core/core <math><75\text{pF/m}</math>, core/shield <math><150\text{pF/m}</math>). Filtered drives can meet the class A limits of EN 55011 and EN 61800-3 Category 2 with this type of motor cable up to 10 meters.

**NOTE:** Refer to Appendix A for recommended cable lengths. Any external line filter should have its chassis connected to the drive chassis by mounting hardware or with the shortest possible wire or braid.

### 3.2.1.6 NEMA 4X (IP65) Input Terminal Block

For NEMA 4X (IP65) models with integrated EMC filter and/or integrated line disconnect, the input terminal block is located on the right-hand side of the SMV inverter in the NEMA 4 X (IP65) enclosure. The single and three phase models are illustrated herein. Refer to paragraph 3.2.3 Control Terminals for pin out information.

Single Phase (2/PE) 120/240 VAC models (ESVxxxN01SMC) with integrated line disconnect

Single Phase (2/PE) 240 VAC models with Filter and/or integrated line disconnect

Three Phase (3/PE) models with Filter and/or integrated line disconnect

#### WARNING

Power remains present for up to 3 minutes on power input terminals (L1, L2 and L3) and output terminals (U, V and W) even when the disconnect switch is in the OFF position. Remove input power ahead of the drive and wait 3 minutes before removing the terminal cover.

## Installation

### 3.2.1.7 Dynamic Brake Connections

For NEMA 1 and NEMA 4X Drives rated up to 30HP (22kW) the Dynamic Brake connections are made as illustrated herein. Refer to the SMV Dynamic Brake Instructions (DBV01) for complete information.

The SMV 40...60Hp (30...45kW) models include a dynamic brake transistor as standard and only require the connection of an external resistor kit for dynamic braking operation. The dynamic brake resistor connections for 40...60 Hp (30...45kW) drives are standard built-in connections as illustrated in the diagram below. In the 40Hp (30kW) model drives, the dynamic brake connector is on the right-hand side of the drive and the terminals from top to bottom are B-, BRAKE and B+. In the 50/60HP (37.5/45 kW) model drives, the dynamic brake connector is on the left-hand side of the drive and the terminals from top to bottom are B+, BRAKE and B-.

External resistor kits must be connected to terminals B+ and BRAKE (no connection to B-). Refer to the table herein for external resistor kit selection. Refer to parameter P189 for enabling the dynamic brake function in the 40...60Hp (30...45kW) models.

| 400/480 VAC SMV Inverter |    |    | Resistor Kit            |           |           |          |

## Installation

### 3.2.2 Fuses/Cable Cross-Sections

**NOTE:** Observe local regulations. Local codes may supersede these recommendations

**WARNING:** Use a FUSE \* for 240V drives requiring > 40A protection and for 400/480/600V drives requiring >32A protection.

|  | Type   | Recommendations   |  |  |                                     |       |    |

### Notes for Fuse and Cable Table:

- (1) Installations with high fault current due to large supply mains may require a type D circuit breaker.
- (2) UL Class CC or T fast-acting current-limiting type fuses, 200,000 AIC, preferred. Bussman KTK-R, JJJ or JJS or equivalent.
- (3) Thermomagnetic type breakers preferred.

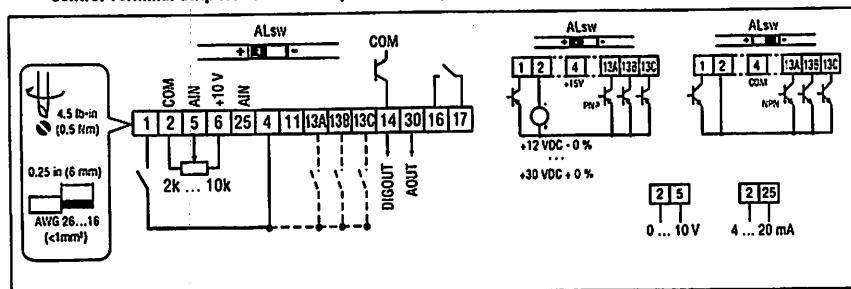

- 11th digit of part number: F = Integral EMC Filter  
L = Integral EMC Filter and Integrated Disconnect Switch (NEMA 4X/IP65 Models only)  
M = Integrated Disconnect Switch (NEMA 4X/IP65 Models only)  
X = No EMC Filter/ No Disconnect Switch
- \* = Last digit of part number: C = N4X Indoor only (convection cooled)  
E = N4X Indoor/Outdoor (convection cooled)  
D = N4X Indoor only (fan cooled)  
F = N4X Indoor/Outdoor (fan cooled)

Observe the following when using Ground Fault Circuit Interrupters (GFCIs):

- Installation of GFCI only between supplying mains and controller.
- The GFCI can be activated by:
  - capacitive leakage currents between the cable screens during operation (especially with long, screened motor cables)
  - connecting several controllers to the mains at the same time
  - RFI filters

### 3.2.3 Control Terminals

#### Control Terminal Strip for 0.33 - 10 HP (0.25 - 7.5 kW):

#### Control Terminal Strip for 15HP (11 kW) and Greater Drives:

#### NOTE

Control and communications terminals provide basic insulation when the drive is connected to a power system rated up to 300V between phase to ground (PE) and the applied voltage on terminals 16 and 17 is less than 250 VAC between phase to phase and ground (PE).

## Installation

### Control Terminal Strip Descriptions

| Terminal | Description                                  | Important                                       |
|----------|--|---|
| 1        | Digital Input: Start/Stop                    | input resistance = 4.3k $\Omega$                |
| 2        | Analog Common                                |   |
| 5        | Analog Input: 0...10 VDC                     | input resistance: >50 k $\Omega$                |
| 6        | Internal DC supply for speed pot             | +10 VDC, max. 10 mA                             |
| 25       | Analog Input: 4...20 mA                      | input resistance: 250 $\Omega$                  |
| 4        | Digital Reference/Common                     | +15 VDC / 0 VDC, depending on assertion level   |
| 11       | Internal DC supply for external devices      | +12 VDC, max. 50 mA                             |

\* = Terminal is part of the terminal strip for the 15HP (11kW) and higher models only.

#### Assertion level of digital inputs

The digital inputs can be configured for active-high or active-low by setting the Assertion Level Switch (ALsw) and P120. If wiring to the drive inputs with dry contacts or with PNP solid state switches, set the switch and P120 to "High" (+). If using NPN devices for inputs, set both to "Low" (-). Active-high (+) is the default setting.

HIGH = +12 ... +30 V  
LOW = 0 ... +3 V

#### NOTE

An F\_AL fault will occur if the Assertion Level switch (ALsw) position does not match the parameter P120 setting and P100 or any of the digital inputs (P121...P124) is set to a value other than 0.

## 4 Commissioning

### 4.1 Local Keypad & Display

|                |  |
|----------------|--|
| <b>Display</b> | <b>START BUTTON</b>  |
|                | In Local Mode (P100 = 0, 4, 6), this button will start the drive.  |
|                | <b>STOP BUTTON</b>   |
|                | Stops the drive, regardless of which mode the drive is in.<br><b>WARNING!</b><br>When JOG is active, the STOP button will not stop the drive!  |
|                | <b>ROTATION</b>  |
|                | In Local Mode (P100 = 0, 4, 6), this selects the motor rotation direction:<br>- The LED for the present rotation direction (FWD or REV) will be on<br>- Press R/F; the LED for the opposite rotation direction will blink<br>- Press M within 4 seconds to confirm the change<br>- The blinking direction LED will turn on, and the other LED will turn off<br><br>When rotation direction is changed while the drive is running, the commanded direction LED will blink until the drive is controlling the motor in the selected direction.<br>Rotation is set in P112. When P112 = 0, rotation is forward only. When P112 = 1 rotation is forward and reverse. |
|                | <b>MODE</b>  |
|                | Used to enter/exit the Parameter Menu when programming the drive and to enter a changed parameter value.   |
|                | <b>UP AND DOWN BUTTONS</b>   |
|                | Used for programming and can also be used as a reference for speed, PID setpoint, or torque setpoint.<br>When the ▲ and ▼ buttons are the active reference, the middle LED on the left side of the display will be on.   |
|                |  |

## Commissioning

|         |  |  |
|---------|--|--|
| Display | <b>START CONTROL</b>   |  |
|         | The REMOTE/LOCAL LEDs indicate the current start control source. If the start control source is a remote keypad or the network, then both LEDs will be OFF.  |  |
|         | <b>REFERENCE CONTROL</b>   |  |
|         | The AUTO/MANUAL LEDs indicate the current reference control source.  |  |
|         | IF P113 = 0 or 2, the AUTO/MANUAL LEDs will match the AUTO LED on the 4-character display. IF P113 = 0 and no AUTO reference has been setup on the terminal strip, the MANUAL LED will turn ON and the AUTO LED will turn OFF.   |  |
|         | IF P113 = 1, the AUTO/MANUAL LEDs show the commanded reference control source as selected by the [CTRL] button. If the [CTRL] button is used to set the reference control source to AUTO but no AUTO reference has been setup on the terminal strip, reference control will follow P101 but the AUTO LED will remain ON. |  |
|         | <b>UNITS LEDs</b>  |  |
|         | HZ: current display value is in Hz   | In Speed mode, if P178 = 0 then HZ LED will be ON. If P178 > 0, the Units LEDs follow the setting of P177 when the drive is in run (non-programming) mode.<br><br>In Torque mode, the HZ LED will be ON when the drive is in run (non-programming) mode.<br><br>In Pid mode, the Units LEDs follow the setting of P203 when the drive is in run (non-programming) mode.<br>If P179 > 0, the Units LEDs will show the unit of the diagnostic parameter that is being displayed. |
|         | %: current display value is in %   |  |
|         | RPM: current display value is in RPM   |  |
|         | AMPS: current display value is in Amps   |  |
|         | /UNITS current display value is a per unit (i.e./sec, /min, /hr, etc.)   |  |

## 4.2 Drive Display and Modes of Operation

### Speed Mode Display

In the standard mode of operation, the drive frequency output is set directly by the selected reference (keypad, analog reference, etc.). In this mode, the drive display will show the drive's output frequency.

### PID Mode Display

When the PID mode is enabled and active, the normal run display shows the actual PID setpoint. When PID mode is not active, the display returns to showing the drive's output frequency.

### Torque Mode Display

When the drive is operating in Vector Torque mode, the normal run display shows the drive's output frequency.

### Alternate (Run-Screen) Display

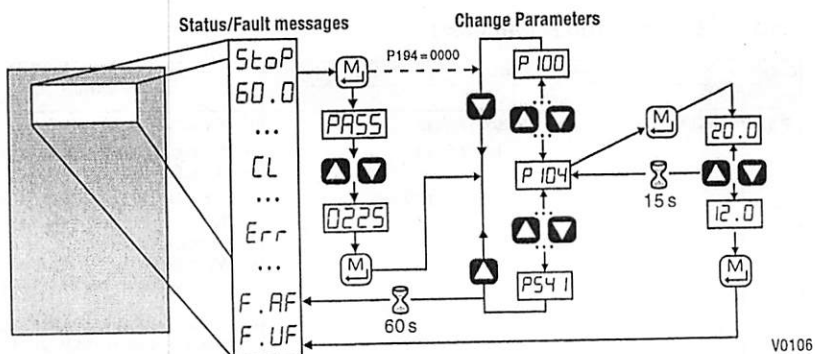

When P179 (Run Screen Display) is set to a value other than 0, one of the diagnostic parameters (P501...P599) is displayed. Example: if P179 is set to 1, then diagnostic parameter P501 (Software version) is displayed. If P179 =2, then P502 (Drive ID) is displayed.

## Commissioning

### 4.3 Parameter Setting

### 4.4 Electronic Programming Module (EPM)

The EPM contains the drives operational memory. Parameter settings are stored in the EPM and setting changes are made to the "User settings" in the EPM.

An optional EPM Programmer (model EEP1RA) is available that allows:

- An EPM to be copied directly to another EPM.
- An EPM to be copied to the memory of the EPM Programmer.
- Stored files can be modified in the EPM Programmer.
- Stored files can be copied to another EPM.

EPM Module  
in SMV Drive

As the EPM Programmer is battery operated, parameter settings can be copied to an EPM and inserted into a drive without power being applied to the drive. This means that the drive will be fully operational with the new settings on the next application of power.

Additionally, when the drives parameter settings are burned into an EPM with the EPM Programmer, the settings are saved in two distinct locations; the "User settings" and the "OEM default settings". While the User settings can be modified in the drive, the OEM settings cannot. Thus, the drive can be reset not only to the "factory" drive default settings (shown in this manual), but can be set to the Original Machine settings as programmed by the OEM.

The user area contents of the EPM are what are copied into the OEM space by the EPM programmer. When parameter modifications are made to the drive and then a copy made via the EPM Programmer, these are the settings that will be available by the OEM selections from P199. The EPM Programmer is the only way to load the OEM area of the EPM. While the EPM can be removed for copying or to use in another drive, it must be installed for the drive to operate (a missing EPM will trigger an F\_F I fault)

### 4.5.7.1 Terminal & Protection Status Display

Parameter P530 allows monitoring of the control terminal points and common drive conditions:

An illuminated LED segment indicates:

- the protective circuit is active (LED 1)
- the Logic Assertion Switch is set to High (+)
- input terminal is asserted (LED 2)
- output terminal is energized (LED 4)
- the Charge Relay is not a terminal, this segment will be illuminated when the Charge Relay is energized (LED 4).

### 4.5.7.2 Keypad Status Display

Parameter P531 allows monitoring of the keypad pushbuttons:

An illuminated LED segment indicates when the button is depressed.

LED 1 and LED 2 are used to indicate pushbutton presses on a remote keypad that is attached to the drive. LED 3 and LED 4 indicate button presses on the local drive keypad.

## Commissioning

### 4.5.8 Onboard Communications Parameters 15-60HP (11-45kW)

The P6xx Onboard Communication parameters are applicable to the 15HP (11kW) and higher models only.

## 4.5.9 Sequencer Parameters

The P700 Sequencer parameters are listed herein. Refer to section 4.5.7 for P56x Sequencer Diagnostic Parameters. The sequencer function consists of 16 step segments, each individual step segment can have its own ramp time, time spent in individual segment and output frequency entered. The sequencer has 3 different modes to control how the drive moves through each individual step segment: Timer Transition, Step Sequence or Timer and Step Sequence.

### P700= 1 (Timer Transition)

Starting at the segment number entered in the "Start Segment" parameter, the drive will automatically move through each of the segments. The time spent in each segment is determined by the values set in the individual "Time in Current Step" parameters.

### P700= 2 (Step Sequence)

Starting at the segment number entered in the "Start Segment" parameter the sequencer will only move to the next segment when a rising edge is applied to the highest priority digital input which is programmed to "Step Sequence" selection "24".

### P700= 3 (Timer Transition or Step Sequence)

Starting at the segment number entered in the "Start Segment" parameter, the drive will automatically move through each of the segments. The time spent in each segment is determined by the values set in the individual "Time in Current Step" parameters, however if a rising edge is applied to the highest priority digital input which is programmed to "Step Sequence" selection "24" it will force the sequencer to step into the next segment.

**NOTE:** A value of "0" in the "Time in current step" parameter (ex: P712), will result in the segment being skipped.

| Code                |  | Possible Settings |  | IMPORTANT   |
|---------------------|--|-------------------|--|---|
| No.                 | Name   | Default           | Selection  |   |
| P700                | Sequencer Mode   | 0                 | 0 Disabled<br>1 Enabled: transition on timer only<br>2 Enabled: transition on rising edge (P121, 122, 123 = 25 step sequence)<br>3 Enabled: transition on timer or rising edge | If P700 = 0 and no reference (P121, P101) points to any of the sequence segments, then P701-P799 will not be displayed on the local keypad. |
| P701                | Sequencer: TB13A Trigger Segment                               | 1                 | 1 - 16<br>TB13A = lowest priority  | Asserting TB13A with selection #24 (Start Sequence), starts the sequence operation from the segment specified in this parameter.            |
| P702                | Sequencer: TB13B Trigger Segment                               | 1                 | 1 - 16<br>TB13B: higher priority than TB13A  | Asserting TB13B with selection #24 (Start Sequence), starts the sequence operation from the segment specified in this parameter.            |
| P703                | Sequencer: TB13C Trigger Segment                               | 1                 | 1 - 16<br>TB13C: higher priority than TB13B, A   | Asserting TB13C with selection #24 (Start Sequence), starts the sequence operation from the segment specified in this parameter.            |
| P704 <sup>(2)</sup> | Sequencer: TB13D Trigger Segment                               | 1                 | 1 - 16<br>TB13D: higher priority than TB13C, B, A  | Asserting TB13D with selection #24 (Start Sequence), starts the sequence operation from the segment specified in this parameter.            |
| P706                | Sequencer: Action after Stop/Start transition or Fault Restart | 0                 | 0 Restart at beginning of sequence<br>1 Restart at beginning of current seg<br>2 Start at beginning of prior segment<br>3 Start at beginning of next segment                   | Pointed by TB13x  |
| P707                | Sequencer: Number of cycles                                    | 1                 | 1 65535  | 1 = single scan; 65535 = continuous loop  |

(2) Parameter applicable to SMV models 15HP (11kW) and higher.

## 4.5.9.2 Sequencer Flow Diagram Right

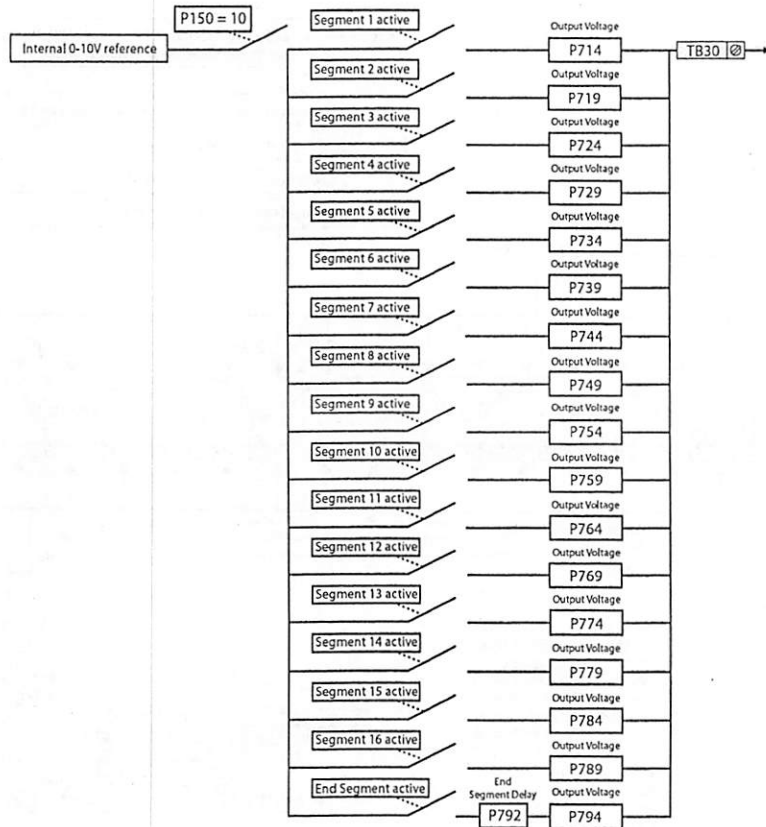

| Action after Stop/Start (P100) transition/digital input (if setup for sequencer mode) transition or restart after trip. |   |
|---|---|
| P706  | Action  |
| 0   | Restart at beginning of sequence (pointed by TB13x) |
| 1   | Restart at beginning of current segment             |
| 2   | Start at beginning of prior segment                 |
| 3   | Start at beginning of next segment                  |

## Commissioning

### 4.5.9.3 Sequencer Status

**NOTE**

On the "End Segment", the output voltage is not present until after the end segment delay P792 has expired. On the other segments the output voltage is present on entry to the segment. The same is true for the digital outputs.

(1) The drive can only be restarted if the error message has been reset.

## Troubleshooting and Diagnostics

### 5 Troubleshooting and Diagnostics

#### 5.1 Status/Warning Messages

| Status / Warning  | Cause   | Remedy  |
|---|---|---|
| <b>br</b> DC-injection brake active   | DC-injection brake activated <ul style="list-style-type: none"> <li>• activation of digital input (P121...P124 = 18)</li> <li>• automatically (P110 = 2, 4...6)</li> <li>• automatically (P111 = 1, 3)</li> </ul> | Deactivate DC-injection brake <ul style="list-style-type: none"> <li>• deactivate digital input</li> <li>• automatically after P175 time has expired</li> </ul>   |
| <b>bF</b> Drive ID warning  | The Drive ID (P502) stored on the EPM does not match the drive model.   | <ul style="list-style-type: none"> <li>• Verify motor data (P302...P306) and perform Auto Calibration.</li> <li>• Set drive mode (P300) to 0 or 1</li> <li>• Reset the drive (P199 to 3 or 4) and reprogram.</li> </ul> |
| <b>CAL</b> Motor Auto-calibration active  | Refer to P300, P399   | Motor Auto-calibration is being performed   |
| <b>cE</b> An EPM that contains valid data from a previous software version has been installed | An attempt was made to change parameter settings  | Parameter settings can only be changed after the EPM data is converted to the current version (P199 = 5)  |
| <b>CL</b> Current Limit (P171) reached  | Motor overload  | <ul style="list-style-type: none"> <li>• Increase P171</li> <li>• Verify drive/motor are proper size for application</li> </ul>   |
| <b>dEC</b> Decel Override   | The drive has stopped decelerating to avoid tripping into HF fault, due to excessive motor regen (2 sec max).   | If drive trips into HF fault: <ul style="list-style-type: none"> <li>• Increase P105, P126</li> <li>• Install Dynamic Braking option</li> </ul>   |
| <b>Err</b> Error  | Invalid data was entered, or an invalid command was attempted   |   |
| <b>FCL</b> Fast Current Limit   | Overload  | Verify drive/motor are proper size for application  |
| <b>FSE</b> Flying Restart Attempt after Fault   | P110 = 5,6  |   |
| <b>GE</b> OEM Settings Operation warning  | An attempt was made to change parameter settings while the drive is operating in OEM Settings mode.   | In OEM Settings mode (P199 = 1), making changes to parameters is not permitted.   |
| <b>GF</b> OEM Defaults data warning   | An attempt was made to use (or reset to) the OEM default settings (P199 = 1 or 2) using an EPM without valid OEM data.  | Install an EPM containing valid OEM Defaults data   |
| <b>LC</b> Fault Lockout   | The drive attempted 5 restarts after a fault but all attempts were unsuccessful (P110 = 3...6)  | <ul style="list-style-type: none"> <li>• Drive requires manual reset</li> <li>• Check Fault History (P500) and correct fault condition</li> </ul>   |
| <b>PdEC</b> PID Deceleration Status   | PID setpoint has finished its ramp but the drive is still decelerating to a stop.   |   |
| <b>PI d</b> PID Mode Active   | Drive has been put into PID Mode.   | Refer to P200   |
| <b>SLP</b> Sleep Mode is active   | Refer to P240...P242  |   |
| <b>SP</b> Start Pending   | The drive has tripped into a fault and will automatically restart (P110 = 3...6)  | To disable Auto-Restart, set P110 = 0...2   |
| <b>SPd</b> PID Mode disabled.   | Drive has been taken out of PID Mode. Refer to P200.  |   |
| <b>StoP</b> Output frequency = 0 Hz (outputs U, V, W inhibited)                               | Stop has been commanded from the keypad, terminal strip, or network   | Apply Start command (Start Control source depends on P100)  |

(1) The drive can only be restarted if the error message has been reset.

## Troubleshooting and Diagnostics

### 5.2 Drive Configuration Messages

When the Mode button is pressed and held, the drive's display will provide a 4-digit code that indicates how the drive is configured. If the drive is in a Stop state when this is done, the display will also indicate which control source commanded the drive to Stop (the two displays will alternate every second).

| Configuration Display   |  |   |  |
|---|--|---|--|

### 5.3 Fault Messages

The messages below show how they will appear on the display when the drive trips. When looking at the Fault History (P500), the F\_ will not appear in the fault message.

| Fault | Cause   | Remedy <sup>(1)</sup>   |
|-------|---|---|
| F_FF  | High Temperature fault<br>Drive is too hot inside   | <ul style="list-style-type: none"> <li>• Reduce drive load</li> <li>• Improve cooling</li> </ul>  |
| F_AL  | Assertion Level fault <ul style="list-style-type: none"> <li>• Assertion Level switch is changed during operation</li> <li>• P120 is changed during operation</li> <li>• P100 or P121...P124 are set to a value other than 0 and P120 does not match the Assertion Level Switch.</li> </ul> | <ul style="list-style-type: none"> <li>• Make sure the Assertion Level switch and P120 are both set for the type of input devices being used, prior to setting P100 or P121...P124.</li> <li>• Refer to 3.2.3 and P120.</li> </ul>                                    |
| F_bF  | Personality fault<br>Drive Hardware   | <ul style="list-style-type: none"> <li>• Cycle Power</li> <li>• Power down and install EPM with valid data</li> <li>• Reset the drive back to defaults (P199 = 3, 4) and then re-program</li> <li>• If problem persists, contact factory technical support</li> </ul> |
| F_cF  | Control fault<br>An EPM has been installed that is either blank or corrupted  |   |
| F_cF  | Incompatible EPM fault<br>An EPM has been installed that contains data from an incompatible parameter version   |   |
| F_cFt | Forced Translation fault<br>An EPM from an old drive put in new drive causes drive to trip F_cFT fault.   | Press [M] (mode button) twice to reset  |

## Troubleshooting and Diagnostics

| Fault                 | Cause   | Remedy <sup>(1)</sup>  |  |
|-----------------------|---|--|--|
| F_dbF                 | Dynamic Braking fault                           | Dynamic braking resistors are overheating  | <ul style="list-style-type: none"> <li>Increase active decel time (P105, P126, P127).</li> <li>Check mains voltage and P107</li> </ul>                       |
| F_EF                  | External fault                                  | <ul style="list-style-type: none"> <li>P121...P124 = 21 and that digital input has been opened.</li> <li>P121...P124 = 22 and that digital input has been closed.</li> </ul> | <ul style="list-style-type: none"> <li>Correct the external fault condition</li> <li>Make sure digital input is set properly for NC or NO circuit</li> </ul> |
| F_F1                  | EPM fault                                       | EPM missing or defective   | Power down and replace EPM   |
| F_F2<br>...<br>F_F12  | Internal faults                                 |  | Contact factory technical support  |
| F_FnF                 | Control Configuration Fault                     | The drive is setup for REMOTE KEYPAD control (P100=2 or 5) but is not setup to communicate with a remote keypad  | Set P400 = 1, or P600 = 1  |
|                       |   | The drive is setup for NETWORK ONLY control (P100=3) but is not setup for network communications   | Set P400 or P600 to a valid network communications protocol selection  |
| F_FoL                 | TB25 (4-20 mA signal) Threshold fault           | 4-20 mA signal (at TB-25) drops below the value set in P164.   | <ul style="list-style-type: none"> <li>Check signal/signal wire</li> <li>Refer to parameters P163 and P164.</li> </ul>                                       |
| F_GF                  | OEM Defaults data fault                         | Drive is powered up with P199 = 1 and OEM settings in the EPM are not valid.   | Install an EPM containing valid OEM Defaults data or change P199 to 0.   |
| F_HF                  | High DC Bus Voltage fault                       | Mains voltage is too high  | Check mains voltage and P107   |
|                       |   | Decel time is too short, or too much regen from motor  | Increase active decel time (P105, P126, P127) or install Dynamic Braking option  |
| F_IL                  | Digital Input Configuration fault (P121...P124) | More than one digital input set for the same function  | Each setting can only be used once (except settings 0 and 3)   |
|                       |   | Only one digital input configured for MOP function (Up, Down)  | One input must be set to MOP Up, another must be set to MOP Down   |
|                       |   | PID mode is entered with setpoint reference and feedback source set to the same analog signal  | Change PID setpoint reference (P121...P124) or feedback source (P201).   |
|                       |   | One of the digital inputs (P121...P124) is set to 10 and another is set to 11...14.  | Reconfigure digital inputs   |
|                       |   | One of the digital inputs (P121...P124) is set to 11 or 12 and another is set to 13 or 14.   |  |
|                       |   | PID enabled in Vector Torque mode (P200 = 1 or 2 and P300 = 5)   | PID cannot be used in Vector Torque mode   |
| F_JF                  | Remote keypad fault                             | Remote keypad disconnected   | Check remote keypad connections  |
| F_LF                  | Low DC Bus Voltage fault                        | Mains voltage too low  | Check mains voltage  |
| F_nId                 | No Motor ID fault                               | An attempt was made to start the drive in Vector or Enhanced V/Hz mode prior to performing the Motor Auto-calibration  | Refer to parameters P300...P399 for Drive Mode setup and calibration.  |
| F_nLF                 | Module communication fault                      | Communication failure between drive and Network Module.  | Check module connections   |
| F_nF1<br>...<br>F_nF9 | Network Faults                                  | Refer to the module documentation, for Causes and Remedies.  |  |

## Troubleshooting and Diagnostics

| Fault |                                    | Cause   | Remedy <sup>(1)</sup>  |
|-------|------------------------------------|---|--|
| F_QF  | Output fault:<br>Transistor fault  | Output short circuit  | Check motor/motor cable  |
|       |                                    | Acceleration time too short   | Increase P104, P125  |
|       |                                    | Severe motor overload, due to:<br>• Mechanical problem<br>• Drive/motor too small for application | <ul style="list-style-type: none"> <li>• Check machine / system</li> <li>• Verify drive/motor are proper size for application</li> </ul>   |
|       |                                    | Boost values too high   | Decrease P168, P169  |
|       |                                    | Excessive capacitive charging current of the motor cable  | <ul style="list-style-type: none"> <li>• Use shorter motor cables with lower charging current</li> <li>• Use low capacitance motor cables</li> <li>• Install reactor between motor and drive.</li> </ul> |
|       |                                    | Failed output transistor  | Contact factory technical support  |
| F_QFI | Output fault: Ground fault         | Grounded motor phase  | Check motor and motor cable  |
|       |                                    | Excessive capacitive charging current of the motor cable  | Use shorter motor cables with lower charging current   |
| F_PF  | Motor Overload fault               | Excessive motor load for too long   | <ul style="list-style-type: none"> <li>• Verify proper setting of P108</li> <li>• Verify drive and motor are proper size for application</li> </ul>  |
| F_rF  | Flying Restart fault               | Controller was unable to synchronize with the motor during restart attempt; (P110 = 5 or 6)       | Check motor / load   |
| F_SF  | Single-Phase fault                 | A mains phase has been lost   | Check mains voltage  |
| F_UF  | Start fault                        | Start command was present when power was applied (P110 = 0 or 2).                                 | <ul style="list-style-type: none"> <li>• Must wait at least 2 seconds after power-up to apply Start command</li> <li>• Consider alternate starting method (P110).</li> </ul>                             |
| F_FRU | TB5 (0-10V signal) Threshold fault | 0-10V signal (at TB5) drops below the value set in P158.  | <ul style="list-style-type: none"> <li>• Check signal/signal wire</li> <li>• Refer to parameters P157 and P158</li> </ul>  |

(1) The drive can only be restarted if the error message has been reset.

## Appendix

### Appendix A

#### A.1 Permissible Cable Lengths

The table herein lists the permissible cable lengths for use with an SMV inverter with an internal EMC filter.

##### NOTE

This table is intended as a reference guideline only; application results may vary. The values in this table are based on testing with commonly available low-capacitance shielded cable and commonly available AC induction motors. Testing is conducted at worst case speeds and loads.

| Maximum Permissible Cable Lengths (Meters) for SMV Model with Internal EMC Filters |                                 |                             |         |                             |         |                             |         |                              |         |
|--|---------------------------------|-----------------------------|---------|-----------------------------|---------|-----------------------------|---------|------------------------------|---------|

## TWO YEAR LIMITED WARRANTY

H.O.K. Sales, Incorporated/AquaMark (referred to as Manufacturer hereinafter) warrants all of its pressure boosting systems (Product) for two years from date of purchase, to be free of defects in materials and workmanship, provided they are installed in accordance with factory specifications (as specified in the "INSTALLATION, OPERATION & MAINTENANCE manual") for each individual system.

This warranty applies to the original purchaser (referred to as Purchaser hereinafter) and subsequent owners. By accepting and keeping this product Purchaser agrees to all the warranty terms and limitations of liability described herein. Manufacturer warrants only to original installation location and only when installed, operated and maintained in accordance with printed instructions accompanying the Product.

All claims must be made within the two (2) year warranty time period measured from the time the Product was purchased.

All warranty claims will be handled as follows: Any defect in material or workmanship will be repaired or, at Manufacturer's option, corrected with new or used replacement parts, or Products, at Manufacturers expense. If after a reasonable number of attempts to remedy the problem, it cannot be repaired so the product will conform to this warranty, a new replacement component or entire Product will be supplied, at the Manufacturer's option. Under no circumstance will any claims for more than the original cost of the Product be accepted, including labor.

This warranty does not cover any failure or problem unless it is caused by a defect in material or workmanship and in addition shall not apply to the following:

- If the product is not correctly installed, operated, repaired, and or maintained as described in the INSTALLATION, OPERATION, & MAINTANANCE manual.
- If any failure or malfunction results from abuse, i.e., freezing, improper or negligent handling, shipping, storage, accident, lightning, flood or environmental conditions.
- If the product is used outside the U.S.A.
- Warranty does not cover any labor costs, shipping and delivery expenses, administrative fees or any costs related to removing or reinstalling the Product.
- If any repair and/or replacement costs are not authorized by Manufacturer or authorized representatives in advance.

Each system has specific electrical and unrestricted piping supply size requirements and they are critical to the application of the one year warranty. See INSTALLATION, OPERATION & MAINTENANCE manual for details.

The remedies in the Warranty are the Purchaser's exclusive remedies. In no circumstances will the Manufacturer or its authorized representatives be liable for more than, and the Purchasers remedies shall not exceed, the price paid for the Product. In no case, shall the Manufacturer or it's authorized representatives be liable for any special damage to property, loss of profits, loss of savings or revenue, loss of use of the Product or any associated equipment, facilities, building or services, downtime, and claims of third parties including customers.

Any covered Warranty service must be authorized by the Manufacturer. Contact the person from whom you purchased the Product, who must receive authorization from the Manufacturer. Before the Manufacturer or an authorized representative determines to provide any replacement parts or Product, it may as a pre-condition to making such a determination, required that the Warranty claimant ship the Product, postage prepaid, to the Manufacturer or an authorized Manufacturer's representative and provide proof of purchase evidenced by the original sales receipt.

In case of replacement of a Product or any component part, the Manufacturer reserves the right to make changes in the design, construction, or material of the substitute components or Products, which shall be subject to all the terms and limitations of the Warranty, except that the applicable warranty period shall be reduced by the amount of time the warranty claimant owned the Product prior to submitting notification of the warranty claim.
